

# Natural Language Processing 1

## Connecting the dots

Katia Shutova

ILLC  
University of Amsterdam

11 December 2020

# Levels of language analysis

1. **Morphology** — the structure of words.
2. **Syntax** — the way words are used to form phrases.
3. **Semantics**
  - ▶ **Lexical semantics** — the meaning of individual words.
  - ▶ **Compositional semantics** — the construction of meaning of longer phrases and sentences (based on syntax).
4. **Discourse** and **pragmatics** — meaning in context.

# Ambiguity

**Ambiguity:** *same strings can mean different things*

- ▶ Morphology: **unionised** (*un- ion -ise -ed* vs. *union -ise -ed*)
- ▶ Word senses: **bank** (finance or river?)
- ▶ Part of speech: **chair** (noun or verb?)
- ▶ Syntactic structure: **I saw a man with a telescope**
- ▶ Discourse relations: **Max fell. John pushed him.**

# Ambiguity

**Ambiguity:** *same strings can mean different things*

- ▶ Morphology: **unionised** (*un- ion -ise -ed* vs. *union -ise -ed*)
- ▶ Word senses: **bank** (finance or river?)
- ▶ Part of speech: **chair** (noun or verb?)
- ▶ Syntactic structure: **I saw a man with a telescope**
- ▶ Discourse relations: **Max fell. John pushed him.**

- ▶ Part of speech: **chair** (noun or verb?)
- ▶ Syntactic structure: **I saw a man with a telescope**
- ▶ Discourse relations: **Max fell. John pushed him.**

## Modelling morphology

unionised: *un- ion -ise -ed* vs. *union -ise -ed*

- ▶ **stemming**, i.e. removing inflections  
*unionise*
- ▶ **lemmatisation**, i.e. full morphological analysis  
*unionise PAST VERB*

# Modelling morphology

*How?*

1. Traditionally, **finite state transducers**
2. More recently, **neural models**: e.g. character LSTMs (advanced NLP courses)

*Why is it useful?*

- ▶ provides information about **word structure**, e.g. *shame -less*. Relevant to semantics.
- ▶ and **grammatical properties**, e.g. part of speech, tense, number. Informative for syntactic tasks.

# Modelling syntax

*How?*

1. **n-gram** language models
  - ▶ compute **probability of a sequence**
2. **Part-of-speech** tagging
  - ▶ **Sequence labelling** task (assign a label to each word)
  - ▶ Hidden Markov Models (**HMM**)
  - ▶ more recently, **neural** sequence labelling (e.g. LSTMs)
3. Syntactic **parsing**
  - ▶ (Probabilistic) **context-free grammars**
  - ▶ Chart parsing
  - ▶ **Dependency** structure

# Modelling syntax

*What kind of information do they capture?*

1. **n-gram** language models
  - ▶ word order
  - ▶ short-distance dependencies
2. **Part-of-speech** tagging
  - ▶ grammatical properties of words
  - ▶ coarse-grained word sense
3. Syntactic **parsing**
  - ▶ hierarchical structure of sentences
  - ▶ dependencies between words
  - ▶ types of phrases (e.g. NP, VP).

# Modelling syntax

*Why is this useful?*

## 1. **n-gram** language models

- ▶ **language generation**, e.g. fluency ranking
- ▶ speech recognition, i.e. hypothesis ranking
- ▶ as features in **classification** tasks

## 2. **Part-of-speech** tagging

- ▶ precursor to **parsing**
- ▶ **lexical** semantics
- ▶ as features in **classification** tasks

## 3. Syntactic **parsing**

- ▶ semantic **composition**
- ▶ **co-reference** resolution (to identify NPs)
- ▶ applications (e.g. summarisation).

# Modelling semantics

*How?*

## 1. **Lexical** semantics

- ▶ **word sense** disambiguation (supervised classification)
- ▶ **distributional** semantics
- ▶ skip-gram **word embeddings**

## 2. **Compositional** semantics

- ▶ compositional **distributional** semantics
- ▶ **neural** models: LSTMs and tree LSTMs

*Which of the above models rely on syntax?*

# Modelling semantics

*What kind of information do these models capture?*

## 1. **Lexical** semantics

- ▶ word meanings / senses
- ▶ semantic **similarity**
- ▶ semantic **relations** (e.g. hyponymy, synonymy)

## 2. **Compositional** semantics

- ▶ meanings of phrases
- ▶ **sentence representation** learning  
(general-purpose representations useful for many tasks –  
underlie SOTA models; discussed in ATCS course)

# Modelling semantics

*Why is this useful?*

## 1. **Lexical** semantics

- ▶ in **applications** (e.g. sentiment, summarisation)
- ▶ in **parsing** (e.g. to resolve PP attachment ambiguity)
- ▶ semantic similarity useful in **co-reference** resolution
- ▶ input to **neural models**

## 2. **Compositional** semantics

- ▶ paraphrasing
- ▶ **sentence similarity** in applications (e.g. ordering in summarisation)
- ▶ **sentence representation** learning underlies SOTA models

# Modelling discourse

*How?*

## 1. **Discourse** relations

- ▶ **Classification** over pairs of sentences
- ▶ Tree-structured representations of documents

## 2. Learning **document representations**

- ▶ **Neural** models: LSTMs, attention, HAN
- ▶ Some later models incorporate discourse structure (ATCS)

## 3. **Co-reference** resolution

- ▶ **Linguistically-motivated** features
- ▶ **Neural** models: Lee et al (2017)

# Modelling discourse

*Why is this useful?*

## 1. **Discourse** relations

- ▶ in applications
- ▶ e.g. **summarisation**: remove specific types of satellites
- ▶ **sentiment**: identify contrasts in discourse

## 2. Learning **document representations**

- ▶ Underlie all **document classification** tasks

## 3. **Co-reference** resolution

- ▶ in **semantics**: pronouns need to be resolved
- ▶ in **applications** (e.g. sentiment, summarisation)

# Why does the course cover so much linguistics?

*Why does the course cover so much linguistics, when all we use nowadays is machine learning anyway?*

To be able to advance the state of the art you need to:

- ▶ understand the nature of the learning problem
- ▶ understand the structure of your data
- ▶ understand what patterns you might find in the data
- ▶ develop an appropriate learning algorithm for this

*Understanding linguistic properties can lead to algorithmic advances in ML, e.g. the **Transformer** architecture. Word meaning variation in context motivated the design of **self-attention**.*

## Exam content

All lectures except guest lectures.

- ▶ Morphological processing
- ▶ n-gram language models
- ▶ Part-of-speech tagging
- ▶ Syntax, formal grammars and syntactic parsing
- ▶ Distributional semantics and word embeddings
- ▶ Compositional distributional semantics
- ▶ Neural sentence representations
- ▶ Discourse processing
- ▶ Summarisation

This is an **open-book** exam.

## Types of questions

- ▶ Explain a particular linguistic phenomenon and why it is challenging for particular NLP methods / applications
- ▶ Explain the strengths and limitations of a particular method
- ▶ Apply a method to a given example
- ▶ Given examples of system errors, explain why these arise
- ▶ How can one apply a method from one NLP task to solve a particular problem in another NLP task

# Exam logistics

## Friday, 18 December, 9-11am

- ▶ Join a **zoom** meeting with your TA at 8:50am
- ▶ Conducted on **ANS platform**: latex or upload a picture
- ▶ PDF with questions also available on Canvas at 9am.
- ▶ If you have questions during the exam, notify your TA via chat.
- ▶ **No other communication is allowed!**
- ▶ **Strict plagiarism checks – do not share your answers!**
- ▶ Submit on ANS before 11am.

More details about the logistics will be posted on Canvas.
